

Graphs represent relationships between entities.
Breadth-First Search explores level by level and is useful for shortest path problems.
Depth-First Search explores deeply and is useful for cycle detection and topological sorting.
Both algorithms are fundamental in graph theory and problem solving.
Graphs represent relationships between entities.
Breadth-First Search explores level by level and is useful for shortest path problems.
Depth-First Search explores deeply and is useful for cycle detection and topological sorting.
Both algorithms are fundamental in graph theory and problem solving.
